Monte Carlo Simulations

- Monte Carlo simulations are a popular tool for methodologists with many uses
  - Determine the accuracy of new methods
  - Compare different methods
  - Perform power analyses
  - Determine model fit in SEM

Monte Carlo Simulations

- General steps in a Monte Carlo Simulation
  1. Specify population parameters
  2. Create a sample of size N, based on population parameters
  3. Analyze sample data from step 2 with chosen statistical method(s).
  4. Repeat steps 2 and 3 for each of r replications.

Software options for Monte Carlo Simulations with SEM

- Mplus
- EQS
- PRELIS/LISREL
- SAS (not automated)
- lavaan (not automated)
- Other R packages (sem, OpenMx) (not automated)
- Others?

simsem

- A new R package designed to automate Monte Carlo Simulations using SEM
- simsem can:
  - Generate data
  - Modify generated data
  - Analyze data
  - Summarize results
  - Use multiple processors across simulations

simsem Features

- Data generation
  - Currently only continuous data are generated.
    - By default data are generated from a multivariate normal distribution
    - Both manifest and latent variables can have non-normal distributions
  - Data can be generated from a covariance matrix and mean vector or through a series of linear equations.

simsem Features

- Data generation (continued)
  - Data can be generated with population misfit
  - Data can be generated with continuously varying parameters
  - Generating and analysis models are specified using LISREL matrices

simsem Features

- Data modification
  - Many type of missing data mechanisms can be simulated
    - MCAR
    - MAR
    - Planned missing data designs
      - “3” Form Design
      - “2” Method Design

simsem Features

- Data analysis
  - All models are fit using lavaan
    - Robust ML estimators are available
    - FIML is used when data are missing
    - Equality constraints can be included
  - Multiple imputation of missing data is performed with Amelia
    - Data are imputed, analyzed and results are combined with Rubin's Rules for each replication

simsem Features

- Summarizing Results
  - Results from a simulation can be automatically summarized
  - Results for each model parameter include:
    - Parameter bias
    - Standard error bias
    - Confidence interval coverage
    - Power

Example 1: Power Analysis

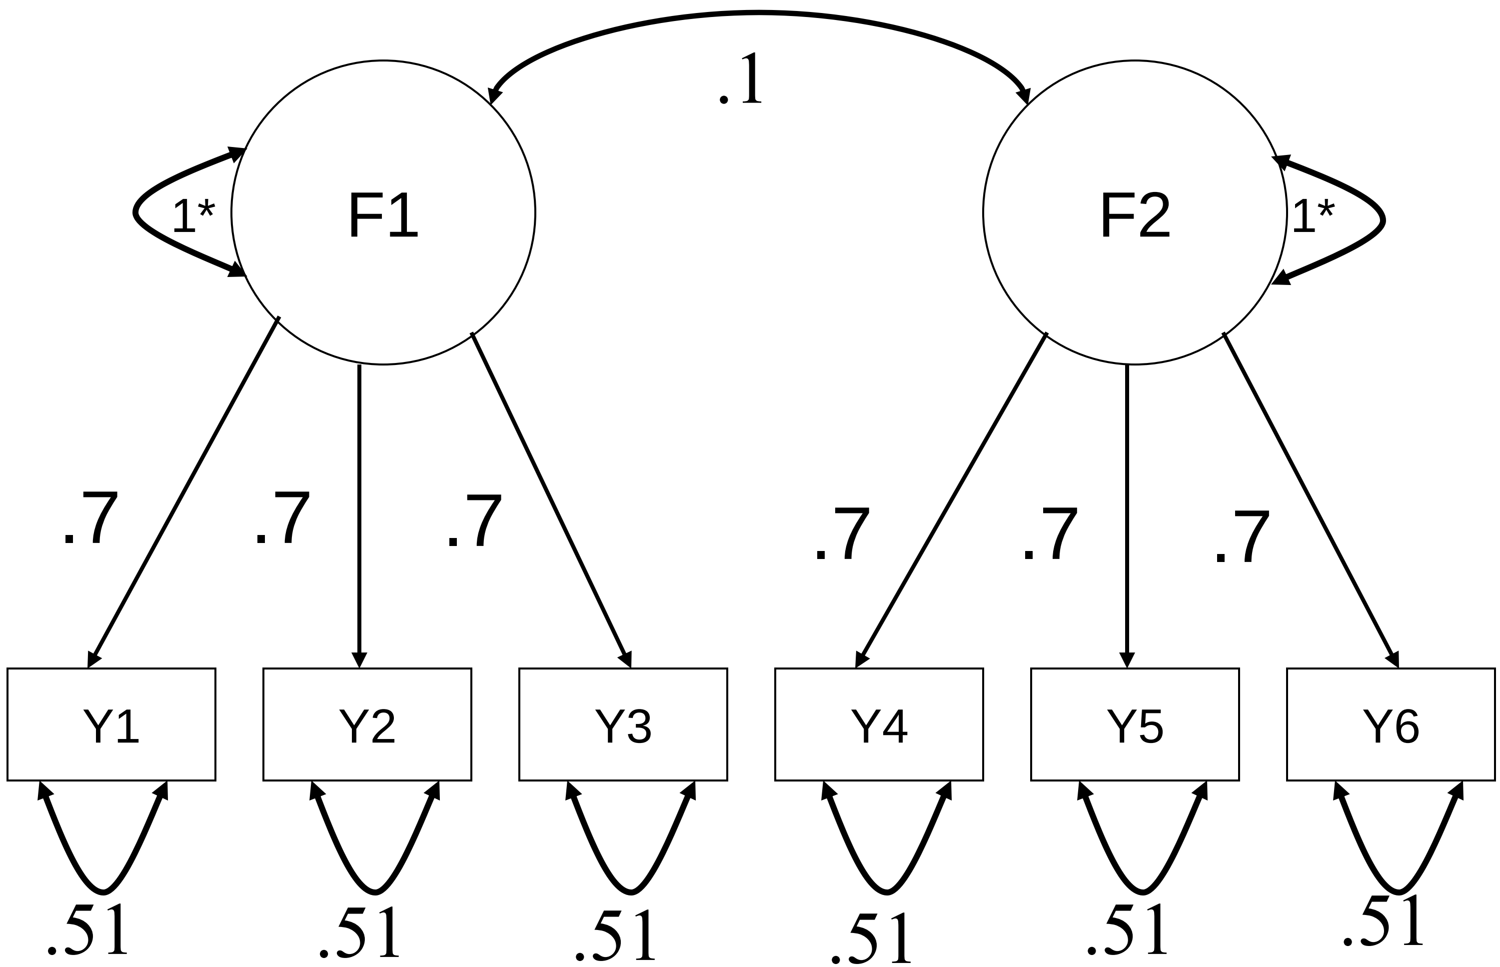
- Given population parameters, what sample size will result in a given level of power (e.g., .80)?
  - Continuously varying sample size approach
    - Specify model and a range of sample sizes
    - Generate 2000+ replications varying sample size across replications
    - Record each parameter's significance for each replication (0 not sig., 1 sig.)

Example 1: Power Analysis

- Given population parameters, what sample size will results in a given level of power (e.g., .80)?
  - Use logistic regression to predict a parameter's significance (across all replications) from the sample size of each replication.
  - The predicted probability from the logistic regression at a given N is power for that parameter at that N

$$p = \frac{e^{B_0 + B_1 N}}{1 + e^{B_0 + B_1 N}}$$

Example 1: Power Analysis



Example 1: Power Analysis

$$LY = \begin{matrix} 0.7 & 0 \\ 0.7 & 0 \\ 0.7 & 0 \\ 0 & 0.7 \\ 0 & 0.7 \\ 0 & 0.7 \end{matrix}$$

$$PS = \begin{matrix} 1 & 0.1 \\ 0.1 & 1 \end{matrix}$$

$$TE = \begin{matrix} 0.51 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0.51 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0.51 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0.51 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0.51 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0.51 \end{matrix}$$

Example 1: Power Analysis

- Results: What sample size results in power for the latent correlation of .80?
  - 3000 replications, randomly varying N between 100-2000
  - logit(power) = $\beta_0 + \beta_1 N$
  - Power = .80 when N = 1436

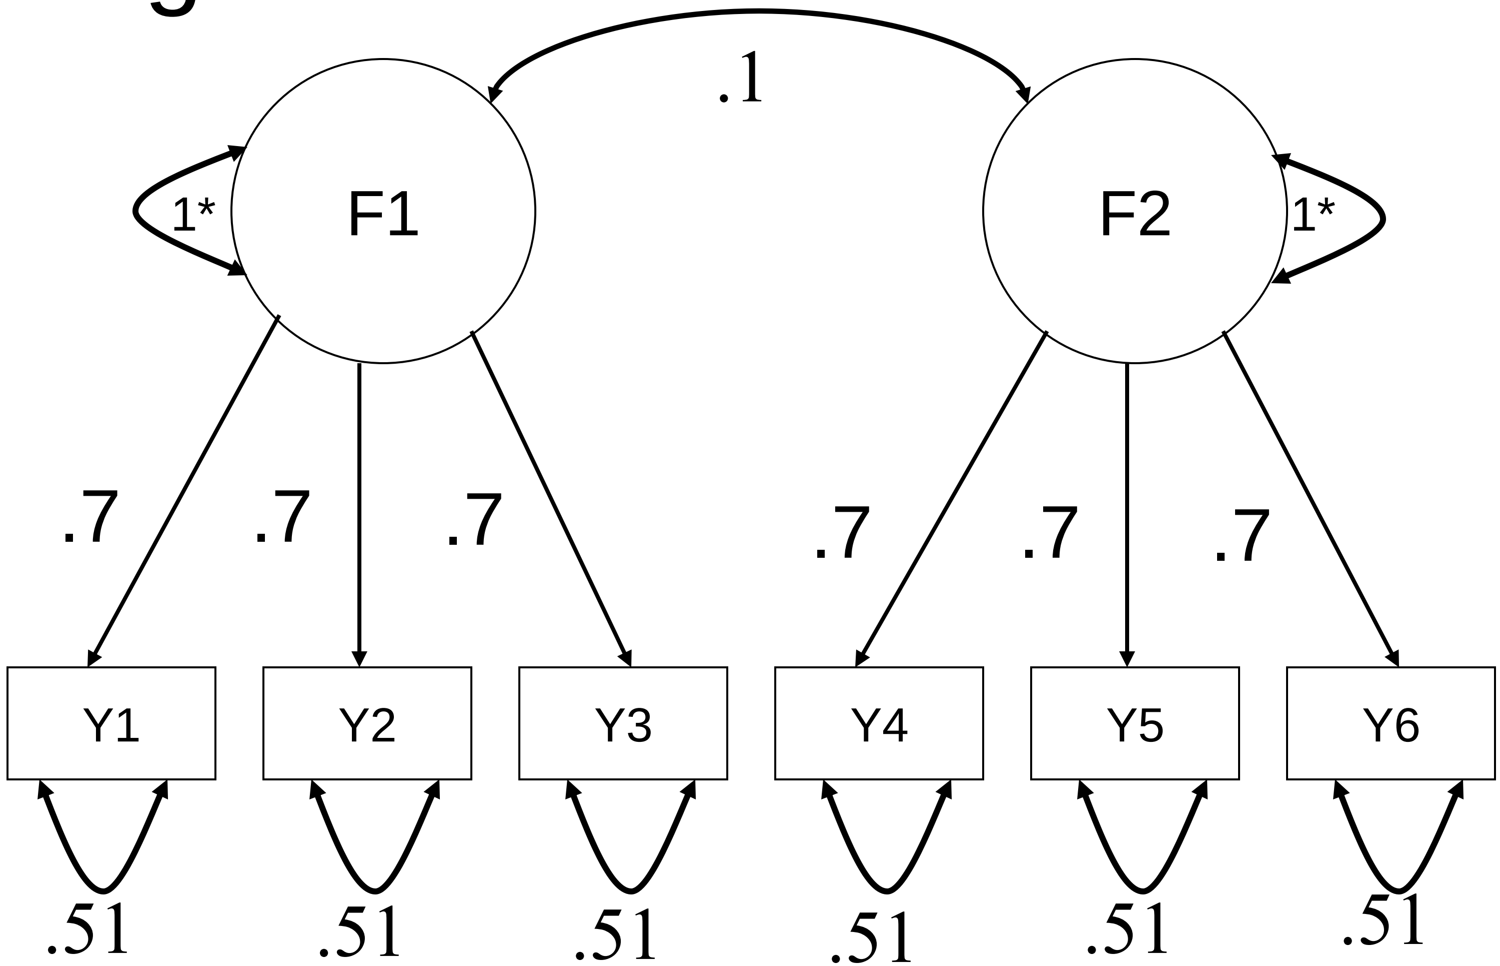
Example 2: Planned Missing Data Design

- Investigate power and bias in a 3 form planned missing data design

Form	Common Set X	Variable Set A	Variable Set B	Variable Set C
1	¼ of items	¼ of items	¼ of items	Missing
2	¼ of items	¼ of items	Missing	¼ of items
3	¼ of items	Missing	¼ of items	¼ of items

Example 2: Planned Missing Data Design



Example 2: Planned Missing Data Design

- Planned missing design:
  - X block:Y1 and Y4
  - A block: Y2 and Y5
  - B blockY3
  - C Block: Y4
- Missing data is handled thought 5 imputations in Amelia
- N = 500
- 1000 replications

Example 2: Results

Some Future Plans

- Multiple group models (coming soon!)
- Categorical indicators
- Multilevel SEM
- Non-linear constraints
- Additional analysis (e.g., OpenMx) and imputation packages (e.g, Mice)
- Latent interactions
- Automate parceling of indicators
- Syntax entry

Also…

- Another R package that may interest R users familiar with SEM
- semTools
  - Useful tools for conducting SEM in R
    - e.g., runMI, imputes missing data, runs each imputed data set, and combines results
  - An open source, community supported package
    - Have an idea for a function? Or a way to improve an existing function? Let us know!

Questions?

- Thanks to
  - Paul Johnson
  - Todd Little
  - Yves Rosseel
